# Regularities in ordered ternary semigroups 

Patchara Pornsurat and Bundit Pibaljommee

#### Abstract

We present various types of regularities in ordered ternary semigroups and describe connections between these regularities.

## 1. Preliminaries

A nonempty set $S$ is called a ternary semigroup if there exists a ternary operation $S \times S \times S \rightarrow S$, written as $\left(x_{1}, x_{2}, x_{3}\right) \mapsto\left[x_{1} x_{2} x_{3}\right]$, such that

$$
\left[\left[x_{1} x_{2} x_{3}\right] x_{4} x_{5}\right]=\left[x_{1}\left[x_{2} x_{3} x_{4}\right] x_{5}\right]=\left[x_{1} x_{2}\left[x_{3} x_{4} x_{5}\right]\right]
$$

for all $x_{1}, x_{2}, x_{3}, x_{4}, x_{5} \in S$. For any $x, y, z$ in a ternary semigroup $S$, we will write $x y z$ instead of $[x y z]$.

Sioson [8] introduced the concept of regularities in $n$-ary semigroups. Dudek and Groździńska [2] gave characterizations of a regular $n$-ary semigroup using its $j$ ideals. As a special case of a regular $n$-ary semigroup, a regular ternary semigroup was studied by Santiago and Sri Bala [7]. Connections between ternary and binary semigroups were firstly studied in [3].

An ordered ternary semigroup ( $S,[], \leqslant$ ) is a ternary semigroup ( $S,[]$ ) together with a partial order relation $\leqslant$ on $S$ which is compatible with the ternary operation, i.e.,

$$
x \leqslant y \Rightarrow x u v \leqslant y u v, \quad u x v \leqslant u y v, \quad u v x \leqslant u v y
$$

for all $x, y, u, v \in S$.
Ordered ternary semigroups have been studied by many authors (see, e.g., [4], [5], [6]). Daddi and Pawar [1] introduced the concepts of ordered quasi-ideals and ordered bi-ideals in ordered ternary semigroups and characterized a regular ordered ternary semigroup using its ordered ideals.

Throughout this paper, we write $S$ for an ordered ternary semigroup, unless specify otherwise.

Let $A, B, C$ be nonempty subsets of $S$. We denote

$$
(A]=\{x \in S \mid x \leqslant a \text { for some } a \in A\},
$$

and note that $A \subseteq(A],(A]=((A]],(A](B])(C] \subseteq(A B C],(A] B C \subseteq(A B C]$, $A(B] C \subseteq(A B C], A B(C] \subseteq(A B C],(A \cup B]=(A] \cup(B]$ and $A \subseteq B$ implies $(A] \subseteq(B]$.

Keywords: ordered ternary semigroup, lightly regular ordered ternary semigroup

A nonempty subset $I$ of $S$ is called an ordered left (resp. right, lateral) ideal of $S$ if $S S I \subseteq I$ ( resp. $I S S \subseteq I, S I S \subseteq I$ ) and $(I]=I$.

If $I$ is an ordered left, right and lateral ideal of $S$, then it is called an ordered ideal of $S$.

A nonempty subset $Q$ of $S$ is called an ordered quasi-ideal of $S$ if $(Q S S] \cap$ $(S Q S] \cap(S S Q] \subseteq Q, \quad(Q S S] \cap(S S Q S S] \cap(S S Q] \subseteq Q$ and $(Q]=Q$.

A nonempty subset $B$ of $S$ is called an ordered bi-ideal of $S$ if $B B B \subseteq B$, $B S B S B \subseteq B$ and $(B]=B$.

An ordered quasi-ideal (bi-ideal) $Q$ of $S$ is called semiprime if $\emptyset \neq A \subseteq S$, $A^{3} \subseteq Q$ implies $A \subseteq Q$.

For a nonempty set $A$ of $S$, we denote by $L(A), R(A), M(A), I(A), Q(A)$ and $B(A)$ the ordered left ideal, the ordered right ideal, the ordered lateral ideal, the ordered ideal, the ordered quasi-ideal and the ordered bi-ideal of $S$ generated by $A$, respectively.

Lemma 1.1. (cf.[1]) Let $A$ be a nonempty subset of $S$. Then
(i) $L(A)=(A \cup S S A]$,
(ii) $R(A)=(A \cup A S S]$,
(iii) $M(A)=(A \cup S A S \cup S S A S S]$,
(iv) $I(A)=(A \cup S S A \cup A S S \cup S A S \cup S S A S S]$,
(v) $B(A)=(A \cup A A A \cup A S A S A]$,
(vi) $Q(A)=(A \cup S S A] \cap(A \cup S A S \cup S S A S S] \cap(A \cup A S S]$.

In particular case, for $a \in S$, we write $L(a), R(a), M(a), I(a), Q(a)$ and $B(a)$ instead of $L(\{a\}), R(\{a\}), M(\{a\}), I(\{a\}), Q(\{a\})$ and $B(\{a\})$, respectively.

## 2. Regularities in ordered ternary semigroups

An ordered ternary semigroup $S$ is called regular, if each its element is regular, i.e., for each $a \in S$ there exists $x \in S$ such that $a \leqslant a x a$.

We note that $S$ is called regular if and only if for each $a \in S$ there exist $x, y \in S$ such that $a \leqslant$ axaya.

Lemma 2.2. (cf. [1]) The following statements are equivalent:
(i) $S$ is regular,
(ii) $A \subseteq(A S A]$ for any $A \subseteq S$,
(iii) $a \in(a S a]$ for any $a \in S$,
(iv) $A \subseteq(A S A S A]$ for any $A \subseteq S$,
(v) $a \in(a S a S a]$ for any $a \in S$.

Definition 2.3. An ordered ternary semigroup $S$ is called left (right) regular, if each its element is left (right) regular, i.e., for each $a \in S$ there exists $x \in S$ such that $a \leqslant x a a(a \leqslant a a x)$.

Note that $S$ is left (right) regular if and only if for each $a \in S$ there exist $x, y \in S$ such that $a \leqslant x y a a a(a \leqslant a a a x y)$.
Lemma 2.4. The following statements are equivalent:
(i) $S$ is left (resp. right) regular,
(ii) $A \subseteq(S A A]$ (resp. $A \subseteq(A A S])$ for any $A \subseteq S$,
(iii) $a \in(S a a]$ ( resp. $a \in(a a S])$ for any $a \in S$,
$(i v) A \subseteq(S S A A A](r e s p . A \subseteq(A A A S S])$ for any $A \subseteq S$,
(v) $a \in(S S a a a]$ (resp. $a \in($ aaaSS $])$ for any $a \in S$.

Theorem 2.5. $S$ is both left regular and right regular ordered ternary semigroup if and only if every ordered quasi-ideal of $S$ is semiprime.

Proof. Let $S$ be both left regular and right regular and $\emptyset \neq A \subseteq S$. Let $Q$ be an ordered quasi-ideal of $S$ such that $A^{3} \subseteq Q$. By Lemma 2.4,

$$
\begin{aligned}
& A \subseteq(A A S] \subseteq((A](A A S](S]] \subseteq(A A A S S] \subseteq(Q S S] \\
& A \subseteq(S A A] \subseteq((S](S A A](A]] \subseteq(S S A A A] \subseteq(S S Q] \\
& A \subseteq(A A S] \subseteq((S A A](A](S]] \subseteq(S A A A S] \subseteq(S Q S]
\end{aligned}
$$

Hence, $A \subseteq(Q S S] \cap(S Q S] \cap(S S Q] \subseteq Q$.
Conversely, assume that every ordered quasi-ideal of $S$ is semiprime and $\emptyset \neq$ $A \subseteq S$. We have $A^{3} \subseteq Q\left(A^{3}\right)=\left(A^{3} \cup S S A^{3}\right] \cap\left(A^{3} \cup S A^{3} S \cup S S A^{3} S S\right] \cap\left(A^{3} \cup A^{3} S S\right]$. By assumption, $A \subseteq\left(A^{3} \cup S S A^{3}\right] \cap\left(A^{3} \cup S A^{3} S \cup S S A^{3} S S\right] \cap\left(A^{3} \cup A^{3} S S\right] \subseteq$ $\left(A^{3} \cup S S A^{3}\right]$. Thus,

$$
A^{3} \subseteq\left(A A\left(A^{3} \cup S S A^{3}\right] \cup S S A^{3}\right] \subseteq\left(\left(A^{5} \cup A A S S A^{3}\right] \cup\left(S S A^{3}\right]\right] \subseteq\left(S S A^{3}\right]
$$

and then $A \subseteq\left(A^{3} \cup S S A^{3}\right] \subseteq\left(\left(S S A^{3}\right] \cup S S A^{3}\right] \subseteq\left(S S A^{3}\right] \subseteq(S A A]$. Similarly, we have $A \subseteq(A A S]$. By Lemma 2.4, $S$ is both left regular and right regular ordered ternary semigroup.

Definition 2.6. An ordered ternary semigroup $S$ is called intra-regular, if each its element is intra-regular, i.e., for each $a \in S$ there exist $x, y \in S$ such that $a \leqslant x a^{3} y$.

Note that $S$ is intra-regular if and only if for each $a \in S$ there exist $w, x, y, z \in S$ such that $a \leqslant w x a^{3} y z$.

Lemma 2.7. The following statements are equivalent:
(i) $S$ is intra-regular,
(ii) $A \subseteq\left(S A^{3} S\right]$ for any $A \subseteq S$,
(iii) $a \in\left(S a^{3} S\right]$ for any $a \in S$,
(iv) $A \subseteq\left(S S A^{3} S S\right]$ for any $A \subseteq S$,
(v) $a \in\left(S S a^{3} S S\right]$ for any $a \in S$.

Theorem 2.8. The following statements are equivalent:
(i) $S$ is intra-regular,
(ii) $L \cap X \cap R \subseteq(L X R]$ for any ordered left ideal $L$, ordered right ideal $R$ and $\emptyset \neq X \subseteq S$.
Proof. ( $\Rightarrow$ ) : Let $a \in L \cap X \cap R$. Since $S$ is intra-regular, there exist $w, x, y, z \in S$ $a \leqslant$ wxaaayz $\in L a R \subseteq L X R \subseteq(L X R]$. Hence, $L \cap X \cap R \subseteq(L X R]$.
$(\Leftarrow):$ Let $a \in S$. By assumption and Lemma 1.1,

$$
\begin{aligned}
& a \in L(a) \cap\{a\} \cap R(a) \subseteq(L(a)\{a\} R(a)] \subseteq((a \cup S S a](a](a \cup a S S]] \\
& \quad \subseteq\left(a^{3}\right] \cup\left(a^{3} S S\right] \cup\left(S S a^{3}\right] \cup\left(S S a^{3} S S\right] .
\end{aligned}
$$

CASE 1: $a \in\left(a^{3}\right] ; a \leqslant a a a \leqslant a a a a a \leqslant$ aaaaaaa $\in S S a^{3} S S$.
CASE 2: $a \in(a a a S S]$; there exist $x, y \in S, a \leqslant a a a x y \leqslant a a(a a a x y) x y \in S S a^{3} S S$.
CASE 3: $a \in\left(\right.$ SSaaa ; there exist $x, y \in S, a \leqslant x y a a a \leqslant x y(x y a a a) a a \in S S a^{3} S S$.
Case 4: $a \in(S S a a a S S]$; it is obvious. By Lemma 2.7, $S$ is intra-regular.
Definition 2.9. An ordered ternary semigroup $S$ is called completely regular, if it is regular, left regular and right regular.

Lemma 2.10. The following statements are equivalent:
(i) $S$ is completely regular,
(ii) $A \subseteq\left(A^{3} S A S A^{3}\right]$ for any $A \subseteq S$,
(iii) $a \in\left(a^{3} S a S a^{3}\right]$ for any $a \in S$.

Theorem 2.11. $S$ is completely regular if and only if every ordered quasi-ideal of $S$ is completely regular.

Proof. Assume that $S$ is completely regular. Let $Q$ be an ordered quasi-ideal of $S$ and $\emptyset \neq A \subseteq Q$. By Lemma 2.10,

$$
\begin{aligned}
& A \subseteq \subseteq\left(A^{3} S A S A^{3}\right] \subseteq\left((A]\left(A^{3} S A S A^{3}\right](A S A S A]\left(A^{3} S A S A^{3}\right](A]\right] \\
& \subseteq\left((A]\left(A^{3} S A S A^{3}\right](A S A]\left(A^{3} S A S A^{3}\right](A]\right] \\
& \subseteq\left(A^{3}(A S A S A) A(A(A S A A A A S) A S A) A^{3}\right] \\
& \subseteq\left(A^{3}(Q S Q S Q) A(Q S Q S Q) A^{3}\right] \\
& \subseteq\left(A^{3} Q A Q A^{3}\right] .
\end{aligned}
$$

By Lemma $2.10, Q$ is completely regular.
The conversely is clear because $S$ itself is an ordered quasi-ideal.

Theorem 2.12. $S$ is completely regular if and only if every ordered bi-ideal of $S$ is semiprime.

Proof. Assume that $S$ is completely regular and $\emptyset \neq A \subseteq S$. Let $B$ be an ordered bi-ideal of $S$ and $A^{3} \subseteq B$. By Lemma 2.10 and Lemma 2.4,

$$
A \subseteq\left(A^{3} S A S A^{3}\right] \subseteq(B S A S B] \subseteq(B S(S S A A A] S B] \subseteq(B S B S B] \subseteq(B]=B
$$

Hence, every ordered bi-ideal of $S$ is semiprime.
Conversely, assume that every ordered bi-ideal of $S$ is semiprime. Let $\emptyset \neq A \subseteq$ $S$. First we show that $\left(A^{3} S A S A^{3}\right]$ is an ordered bi-ideal of $S$. Thus,

$$
\begin{aligned}
\left(A^{3} S A S A^{3}\right] S\left(A^{3} S A S A^{3}\right] S\left(A^{3} S A S A^{3}\right] & \subseteq\left(A^{3} S A S A^{3} S A^{3} S A S A^{3} S A^{3} S A S A^{3}\right] \\
& =\left(A^{3}\left(S A S A^{3} S A^{3} S\right) A\left(S A^{3} S A^{3} S A S\right) A^{3}\right] \\
& \subseteq\left(A^{3} S A S A^{3}\right]
\end{aligned}
$$

Clearly, $\left(\left(A^{3} S A S A^{3}\right]\right]=\left(A^{3} S A S A^{3}\right]$. So, $\left(A^{3} S A S A^{3}\right]$ is ordered bi-ideals of $S$. Since $A^{9} \subseteq\left(A^{3} S A S A^{3}\right]$, by assumption, $A^{3} \subseteq\left(A^{3} S A S A^{3}\right]$, and $A \subseteq\left(A^{3} S A S A^{3}\right]$. By Lemma $2.10, S$ is completely regular.

Now, we define the notions of a left lightly regularity and a right lightly regularity of an ordered ternary semigroups as follows.

Definition 2.13. An ordered ternary semigroup $S$ is called left (right) lightly regular, if each its element is left (light) lightly regular), i.e., for each $a \in S$ there exist $x, y, z \in S$ such that $a \leqslant x y a z a(a \leqslant$ axayz $)$.

Lemma 2.14. The following statements are equivalent:
(i) $S$ is left (resp. right) lightly regular,
(ii) $A \subseteq(S S A S A](r e s p . A \subseteq(A S A S S])$ for any $A \subseteq S$,
(iii) $a \in(S S a S a]$ (resp. $a \in(a S a S S])$ for any $a \in S$.

Theorem 2.15. The following statements are equivalent:
(i) $S$ is left lightly regular,
(ii) $R \cap M \cap L \subseteq(S S R M L]$ for any ordered left ideal $L$, ordered right ideal $R$ and ordered lateral ideal $M$ of $S$,
(iii) $L \subseteq(L S L]$ for any ordered left ideal $L$ of $S$,
(iv) $L \cap M \subseteq(L M L]$ for any ordered left ideal $L$ and ordered lateral ideal $M$ of $S$.

Proof. $(i) \Leftrightarrow(i i)$ : Let $L, R$ and $M$ be an ordered left ideal, an ordered right ideal and an ordered lateral ideal of $S$, respectively and $a \in R \cap M \cap L$. Since $S$ is left lightly regular, there exist $x, y, z \in S$ such that $a \leqslant x y a z a \leqslant x y a z(x y a z a)=$ $x y(a z x)(y a z) a \in S S R M L$. Hence, $R \cap M \cap L \subseteq(S S R M L]$.

Conversely, let $\emptyset \neq A \subseteq S$. Then $A \subseteq R(A) \cap M(A) \cap L(A)$. By assumption and Lemma 1.1,

$$
\begin{aligned}
A \subseteq & R(A) \cap M(A) \cap L(A) \subseteq(S S R(A) M(A) L(A)] \\
= & ((S](S](A \cup A S S](A \cup S A S \cup S S A S S](A \cup S S A]] \\
\subseteq & \left(S^{2} A^{3} \cup S^{2} A^{2} S^{2} A \cup S^{2} A S A S A \cup S^{2} A S A S^{3} A \cup S^{2} A S^{2} A S^{2} A\right. \\
& \cup S^{2} A S^{2} A S^{4} A \cup S^{2} A S^{2} A^{2} \cup S^{2} A S^{2} A S^{2} A \cup S^{2} A S^{3} A S A \\
& \left.\cup S^{2} A S^{3} A S^{3} A \cup S^{2} A S^{4} A S^{2} A \cup S^{2} A S^{4} A S^{4} A\right] \\
\subseteq & (S S A S A] .
\end{aligned}
$$

By Lemma 2.14, $S$ is left lightly regular.
$(i) \Rightarrow(i v)$ : Let $L$ and $M$ be an ordered left ideal and an ordered lateral ideal of $S$ and $a \in L \cap M$. Since $S$ is left lightly regular, there exist $x, y, z \in S$ such that $a \leqslant x y a z a \leqslant x y(x y a z a) z a=(x y x y a)(z a z) a \in L M L$. Hence, $L \cap M \subseteq(L M L]$.
$(i v) \Rightarrow(i i i)$ : It is clear because $S$ itself is an ordered lateral ideal of $S$
$(i i i) \Rightarrow(i)$ : Let $a \in S$. Then $a \in L(a)$. By assumption and Lemma 1.1,

$$
\begin{aligned}
a \in L(a) & \subseteq(L(a) S L(a)]=((a \cup S S a](S](a \cup S S a]] \\
& \subseteq(a S a \cup a S S S a \cup S S a S a \cup S S a S S S a] \\
& =(a S a] \cup(a S S S a] \cup(S S a S a] \cup(S S a S S S a] .
\end{aligned}
$$

Case 1: $a \in(a S a]$; there exists $x \in S, a \leqslant a x a \leqslant a x(a x a) \in S S a S a$.
Case 2: $a \in(a S S S a]$; there exist $x, y, z \in S, a \leqslant a x y z a \leqslant a x y z(a x y z a) \in S S a S a$.
Case 3: $a \in(S S a S a]$; it is obvious.
Case 4: $a \in(S S a S S S a]$; it is obvious, since $(S S a S S S a] \subseteq(S S a S a]$.
Thus, $S$ is left lightly regular.
The next theorem can be similarly proved as Theorem 2.15.
Theorem 2.16. The following statements are equivalent:
(i) $S$ is right lightly regular,
(ii) $R \cap M \cap L \subseteq(R M L S S]$ for any ordered left ideal L, ordered right ideal $R$ and ordered lateral ideal $M$ of $S$,
(iii) $R \subseteq(R S R]$ for any ordered right ideal $L$ of $S$,
(iv) $R \cap M \subseteq(R M R]$ for any ordered right ideal $R$, ordered lateral ideal $M$ of $S$.

Definition 2.17. An ordered ternary semigroup $S$ is called generalized regular, if each its element is generalized regular, i.e., for each $a \in S$ there exist $w, x, y, z$ such that $a \leqslant w x a y z$.

Lemma 2.18. The following statements are equivalent:
(i) $S$ is generalized regular,
(ii) $A \subseteq(S S A S S]$ for any $A \subseteq S$,
(iii) $a \in(S S a S S]$ for any $a \in S$.

Theorem 2.19. The following statements are equivalent:
(i) $S$ is generalized regular,
(ii) $L \subseteq(S S L S S]$ for any ordered left ideal $L$ of $S$,
(iii) $R \subseteq(S S R S S]$ for any ordered right ideal $R$ of $S$,
(iv) $M \subseteq(S S M S S]$ for any ordered lateral ideal $M$ of $S$,
$(v) I \subseteq(S S I S S]$ for any ordered ideal $I$ of $S$.
Proof. $(i) \Leftrightarrow(v)$ : Let $I$ be an ordered ideal of $S$. By Lemma 2.18, $I \subseteq(S S I S S]$. Conversely, let $a \in S$. Then $a \in I(a)$. By assumption and Lemma 1.1,

$$
\begin{aligned}
a & \in I(a) \subseteq(S S I(a) S S] \subseteq((S](S](a \cup S S a \cup a S S \cup S a S \cup S S a S S](S](S]] \\
& \subseteq\left(S^{2} a S^{2} \cup S^{4} a S^{2} \cup S^{2} a S^{4} \cup S^{3} a S^{3} \cup S^{4} a S^{4}\right] \\
& =\left(S^{2} a S^{2}\right] \cup\left(S^{4} a S^{2}\right] \cup\left(S^{2} a S^{4}\right] \cup\left(S^{3} a S^{3}\right] \cup\left(S^{4} a S^{4}\right]
\end{aligned}
$$

CASE 1: $a \in\left(S^{2} a S^{2}\right]$; it is obvious.
CASE 2: $a \in\left(S^{4} a S^{2}\right]$; it is obvious, since $\left(S^{4} a S^{2}\right] \subseteq\left(S^{2} a S^{2}\right]$.
CaSE 3: $a \in\left(S^{2} a S^{4}\right]$; it is obvious, since $\left(S^{2} a S^{4}\right] \subseteq\left(S^{2} a S^{2}\right]$.
CASE 4: $a \in\left(S^{3} a S^{3}\right]$; there exist $u, v, w, x, y, z \in \bar{S}, a \leqslant u v w a x y z \leqslant$ $u v w(u v w a x y z) x y z=(u v w)(u v w) a(x y z)(x y z) \in S S a S S$.
CASE 5: $a \in\left(S^{4} a S^{4}\right]$; it is obvious, since $\left(S^{4} a S^{4}\right] \subseteq\left(S^{2} a S^{2}\right]$.
Thus, $S$ is generalized regular.
$(i) \Leftrightarrow(i i) \Leftrightarrow(i i i) \Leftrightarrow(i v)$ Can be proved similarly.

## 3. Connections between regularities

The proof of following proposition is not difficult.
Proposition 3.1. Let $S$ be an ordered ternary semigroup.
(i) If $S$ is completely regular, then it is regular, left regular and right regular.
(ii) If $S$ is left or right regular, then it is intra-regular.
(iii) If $S$ is left (resp. right) regular, then it is left (resp. right) lightly regular.
(iv) If $S$ is regular, then it is left and right lightly regular.
(v) If $S$ is intra-regular or left lightly regular or right lightly regular, then it is generalized regular.

Now, we give examples to show that the converses statements are not true.
Example 3.2. Let $S=\{a, b, c, d\}$. A ternary operation [ ] on $S$ and the figure of a partial order relation $\leqslant$ on $S$ are as follows:

| [] | $a$ | $b$ | $c$ | $d$ |
| :---: | :---: | :---: | :---: | :---: |
| $a a$ | $a$ | $a$ | $a$ | $d$ |
| $a b$ | $a$ | $a$ | $a$ | $d$ |
| $a c$ | $a$ | $a$ | $a$ | $d$ |
| $a d$ | $d$ | $d$ | $d$ | $d$ |

| [] | $a$ | $b$ | $c$ | $d$ |
| :---: | :---: | :---: | :---: | :---: |
| $b a$ | $b$ | $b$ | $b$ | $d$ |
| $b b$ | $b$ | $b$ | $b$ | $d$ |
| $b c$ | $b$ | $b$ | $b$ | $d$ |
| $b d$ | $d$ | $d$ | $d$ | $d$ |

| [] | $a$ | $b$ | $c$ | $d$ |
| :---: | :---: | :---: | :---: | :---: |
| $c a$ | $a$ | $a$ | $a$ | $d$ |
| $c b$ | $a$ | $a$ | $a$ | $d$ |
| $c c$ | $a$ | $a$ | $a$ | $d$ |
| $c d$ | $d$ | $d$ | $d$ | $d$ |

| [] | $a$ | $b$ | $c$ | $d$ |
| :---: | :---: | :---: | :---: | :---: |
| $d a$ | $d$ | $d$ | $d$ | $d$ |
| $d b$ | $d$ | $d$ | $d$ | $d$ |
| $d c$ | $d$ | $d$ | $d$ | $d$ |
| $d d$ | $d$ | $d$ | $d$ | $d$ |

It is clear that $a, b, d$ are left lightly regular. Since $c \in(S S c S c]=S, S$ is left lightly regular. However, $S$ is neither regular nor right lightly regular because $c \notin(c S c]=\{a, d\}=(c S c S S]$.
Example 3.3. Let $S=\{a, b, c, d\}$. A ternary operation [] on $S$ and the figure of a partial order relation $\leqslant$ on $S$ are as follows:

| [] | $a$ | $b$ | $c$ | $d$ |
| :---: | :---: | :---: | :---: | :---: |
| $a a$ | $a$ | $b$ | $a$ | $d$ |
| $a b$ | $a$ | $b$ | $a$ | $d$ |
| $a c$ | $a$ | $b$ | $a$ | $d$ |
| $a d$ | $d$ | $d$ | $d$ | $d$ |

| [] | $a$ | $b$ | $c$ | $d$ |
| :---: | :---: | :---: | :---: | :---: |
| $b a$ | $a$ | $b$ | $a$ | $d$ |
| $b b$ | $a$ | $b$ | $a$ | $d$ |
| $b c$ | $a$ | $b$ | $a$ | $d$ |
| $b d$ | $d$ | $d$ | $d$ | $d$ |

| [] | $a$ | $b$ | $c$ | $d$ |
| :---: | :---: | :---: | :---: | :---: |
| $c a$ | $a$ | $b$ | $a$ | $d$ |
| $c b$ | $a$ | $b$ | $a$ | $d$ |
| $c c$ | $a$ | $b$ | $a$ | $d$ |
| $c d$ | $d$ | $d$ | $d$ | $d$ |

| [] | $a$ | $b$ | $c$ | $d$ |
| :---: | :---: | :---: | :---: | :---: |
| $d a$ | $d$ | $d$ | $d$ | $d$ |
| $d b$ | $d$ | $d$ | $d$ | $d$ |
| $d c$ | $d$ | $d$ | $d$ | $d$ |
| $d d$ | $d$ | $d$ | $d$ | $d$ |

It is clear that $a, b, d$ are right lightly regular. Since $c \in(c S c S S]=S, \mathrm{~S}$ is right lightly regular. However, $S$ is neither regular nor left lightly regular because $c \notin(c S c]=\{a, d\}=(S S c S c]$.

Example 3.4. Let $S=\{a, b, c, d, e, f\}$. A ternary operation [] on $S$ is as follows:

| [] | $a$ | $b$ | $c$ | $d$ | $e$ | $f$ |  |  |  |  |  |  |  |

Define a partial order relation $\leqslant$ on $S$ by $\leqslant:=\{(x, x) \mid x \in S\}$. It is clear $a, b, c, d, e$ are regular. Since $f \in(f S f]=\{a, e, f\}, S$ is regular. So, $S$ is right lightly regular. However, $S$ is neither right regular nor intra-regular because $f \notin(f f S]=\{a, e\}=$ ( $\left.S S f^{3} S S\right]$.
Example 3.6. Let $S=\{a, b, c, d, e\}$. A ternary operation [ ] on $S$ and the figure of a partial order relation $\leqslant$ on $S$ are as follows:

| [] | $a$ | $b$ | $c$ | $d$ | $e$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $a a$ | $b$ | $b$ | $b$ | $b$ | $e$ |
| $a b$ | $b$ | $b$ | $b$ | $b$ | $e$ |
| $a c$ | $b$ | $b$ | $b$ | $b$ | $e$ |
| $a d$ | $b$ | $b$ | $b$ | $b$ | $e$ |
| $a e$ | $e$ | $e$ | $e$ | $e$ | $e$ |

| [] | $a$ | $b$ | $c$ | $d$ | $e$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $b a$ | $b$ | $b$ | $b$ | $b$ | $e$ |
| $b b$ | $b$ | $b$ | $b$ | $b$ | $e$ |
| $b c$ | $b$ | $b$ | $b$ | $b$ | $e$ |
| $b d$ | $b$ | $b$ | $b$ | $b$ | $e$ |
| $b e$ | $e$ | $e$ | $e$ | $e$ | $e$ |

| [] | $a$ | $b$ | $c$ | $d$ | $e$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $c a$ | $c$ | $c$ | $c$ | $c$ | $e$ |
| $c b$ | $c$ | $c$ | $c$ | $c$ | $e$ |
| $c c$ | $c$ | $c$ | $c$ | $c$ | $e$ |
| $c d$ | $c$ | $c$ | $c$ | $c$ | $e$ |
| $c e$ | $e$ | $e$ | $e$ | $e$ | $e$ |

| [] | $a$ | $b$ | $c$ | $d$ | $e$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $d a$ | $c$ | $c$ | $c$ | $c$ | $e$ |
| $d b$ | $c$ | $c$ | $c$ | $c$ | $e$ |
| $d c$ | $c$ | $c$ | $c$ | $c$ | $e$ |
| $d d$ | $c$ | $c$ | $c$ | $d$ | $e$ |
| $d e$ | $e$ | $e$ | $e$ | $e$ | $e$ |

| [] | $a$ | $b$ | $c$ | $d$ | $e$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $e a$ | $e$ | $e$ | $e$ | $e$ | $e$ |
| $e b$ | $e$ | $e$ | $e$ | $e$ | $e$ |
| $e c$ | $e$ | $e$ | $e$ | $e$ | $e$ |
| $e d$ | $e$ | $e$ | $e$ | $e$ | $e$ |
| $e e$ | $e$ | $e$ | $e$ | $e$ | $e$ |

It is clear $b, c, d, e$ are left regular. Since $a \in(S a a]=\{a, b, c, e\}, S$ is left regular. So, $S$ is intra-regular and generalized regular. However, $S$ is neither right lightly regular nor regular because $a \notin(a S a S S]=\{b, e\}=(a S a]$.

Example 3.7. Let $S=\{a, b, c, d, e\}$. A ternary operation [ ] on $S$ and the figure of a partial order relation $\leqslant$ on $S$ are as follows:

| [] | $a$ | $b$ | $c$ | $d$ | $e$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $a a$ | $b$ | $b$ | $c$ | $c$ | $e$ |
| $a b$ | $b$ | $b$ | $c$ | $c$ | $e$ |
| $a c$ | $b$ | $b$ | $c$ | $c$ | $e$ |
| $a d$ | $b$ | $b$ | $c$ | $c$ | $e$ |
| $a e$ | $e$ | $e$ | $e$ | $e$ | $e$ |

| [] | $a$ | $b$ | $c$ | $d$ | $e$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $b a$ | $b$ | $b$ | $c$ | $c$ | $e$ |
| $b b$ | $b$ | $b$ | $c$ | $c$ | $e$ |
| $b c$ | $b$ | $b$ | $c$ | $c$ | $e$ |
| $b d$ | $b$ | $b$ | $c$ | $c$ | $e$ |
| $b e$ | $e$ | $e$ | $e$ | $e$ | $e$ |

| [] | $a$ | $b$ | $c$ | $d$ | $e$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $c a$ | $b$ | $b$ | $c$ | $c$ | $e$ |
| $c b$ | $b$ | $b$ | $c$ | $c$ | $e$ |
| $c c$ | $b$ | $b$ | $c$ | $c$ | $e$ |
| $c d$ | $b$ | $b$ | $c$ | $c$ | $e$ |
| $c e$ | $e$ | $e$ | $e$ | $e$ | $e$ |

| [] | $a$ | $b$ | $c$ | $d$ | $e$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $d a$ | $b$ | $b$ | $c$ | $c$ | $e$ |
| $d b$ | $b$ | $b$ | $c$ | $c$ | $e$ |
| $d c$ | $b$ | $b$ | $c$ | $c$ | $e$ |
| $d d$ | $b$ | $b$ | $c$ | $d$ | $e$ |
| $d e$ | $e$ | $e$ | $e$ | $e$ | $e$ |

| [] | $a$ | $b$ | $c$ | $d$ | $e$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $e a$ | $e$ | $e$ | $e$ | $e$ | $e$ |
| $e b$ | $e$ | $e$ | $e$ | $e$ | $e$ |
| $e c$ | $e$ | $e$ | $e$ | $e$ | $e$ |
| $e d$ | $e$ | $e$ | $e$ | $e$ | $e$ |
| $e e$ | $e$ | $e$ | $e$ | $e$ | $e$ |

It is clear $b, c, d, e$ are right regular. Since $a \in(a a S]=\{a, b, c, e\}, S$ is right regular. So, $S$ is intra-regular and generalized regular. However, $S$ is neither left lightly regular nor regular because $a \notin(S S a S a]=\{b, e\}=(a S a]$.

Example 3.8. Let $S=\{a, b, c, d\}$. A ternary operation [] on $S$ and the figure of a partial order relation $\leqslant$ on $S$ are as follows:

| [] | $a$ | $b$ | $c$ | $d$ |
| :---: | :---: | :---: | :---: | :---: |
| $a a$ | $a$ | $a$ | $a$ | $a$ |
| $a b$ | $a$ | $a$ | $a$ | $a$ |
| $a c$ | $a$ | $a$ | $a$ | $a$ |
| $a d$ | $a$ | $a$ | $a$ | $a$ |

| [] | $a$ | $b$ | $c$ | $d$ |
| :---: | :---: | :---: | :---: | :---: |
| $b a$ | $a$ | $a$ | $a$ | $a$ |
| $b b$ | $a$ | $b$ | $b$ | $b$ |
| $b c$ | $a$ | $b$ | $b$ | $b$ |
| $b d$ | $a$ | $b$ | $b$ | $b$ |

| [] | $a$ | $b$ | $c$ | $d$ |
| :---: | :---: | :---: | :---: | :---: |
| $c a$ | $a$ | $a$ | $a$ | $a$ |
| $c b$ | $a$ | $b$ | $b$ | $b$ |
| $c c$ | $a$ | $b$ | $b$ | $b$ |
| $c d$ | $a$ | $b$ | $b$ | $c$ |

| [] | $a$ | $b$ | $c$ | $d$ |  | $c$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $d a$ | $a$ | $a$ | $a$ | $a$ |  |  |  |
| $b$ | $a$ | $b$ | $b$ | $b$ |  |  |  |
| $d c$ | $a$ | $b$ | $b$ | $c$ |  | $\bullet$ | $\bullet$ |
| $d d$ | $a$ | $b$ | $c$ | $d$ | $a$ | $b$ | $d$ |

It is clear $a, b, d$ are generalized regular. Since $c \in(S S c S S]=\{a, b, c\}, S$ is generalized regular. $S$ is not intra-regular because $c \notin\left(S S c^{3} S S\right]=\{a, b\}$.

Example 3.9. Let $S=\{a, b, c, d, e, f, g\}$. A ternary operation [] on $S$ and the figure of a partial order relation $\leqslant$ on $S$ are as follows:

| [ ] | $a$ | $b$ | $c$ | $d$ | $e$ | $f$ | $g$ | [ ] | $a$ | $b$ | c | $d$ | $e$ | $f$ | $g$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $a a$ | $a$ | $a$ | $a$ | $a$ | $e$ | $a$ | $a$ | ba | $a$ | $a$ | $a$ | $a$ | $e$ | $a$ | $a$ |

| $g b$ | $a$ | $f$ | $f$ | $g$ | $e$ | $f$ | $g$ |
| $g c$ | $a$ | $f$ | $f$ | $g$ | $e$ | $f$ | $g$ |
| $g d$ | $a$ | $f$ | $f$ | $g$ | $e$ | $f$ | $g$ |
| $g e$ | $e$ | $e$ | $e$ | $e$ | $e$ | $e$ | $e$ |
| $g f$ | $a$ | $f$ | $f$ | $g$ | $e$ | $f$ | $g$ |
| $g g$ | $a$ | $f$ | $f$ | $g$ | $e$ | $f$ | $g$ |

It is clear $a, b, d, e, f, g$ are left regular. Since $c \in(S c c]=\{a, b, c, e, f\}, S$ is left regular. Similarly, $a, b, d, e, f, g$ are right regular and $c \in(c c S]=\{a, b, c, d, e\}, S$ is right regular. However, $S$ is not regular because $c \notin(c S c]=\{a, b, e\}$.

Now, we conclude the connections of the eight regularities as the figure.
